Topic: Programing languages

Github link : https://github.com/roualashraf/computer-project-

Github page : https://roualashraf.github.io/computer-project-/
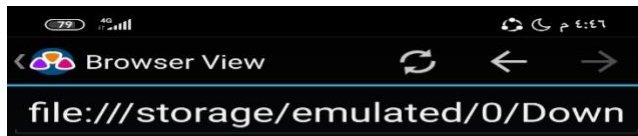

Application brief :

The language of the program is the computer language, which is a set of commands that are directed to the computer to implement the commands addressed to it. Programming language began as simple and found, but with the increase in the need for it and the spread of computers, it became necessary to develop this language.

 It went through several stages of development until it became a language that is close to the human language and the programming languages multiply according to their levels, including high-level languages, low-level languages and medium-level languages.

-Programming language is the language of the computer and it deals with it to implement the orders addressed to it. - This language went through many stages of development, starting with a very simple one, and it was called the language of God. - Programming language has gone through many developments summarized in five generations, divided into three sections 1 - High level of programming 2 - Intermediate level 3 - Low level

- Abstract

the first generation	the second generation	the third generation	the fourth generation	the fifth generation
it is the first and simplest programming language, it is called the language of God, and it is characterized by the speed of executing orders even though it is a complex language	language designed to address the objects of the language of God, but it took more time than the language of God	oldest high-level programming languages and it is a language very close to the human language	languages that are easy to use in the third generation languages and do not require steps to implement them	languages are mostly used in artificial intelligence programs

Programming languages went through many developmental stages, starting with a digital language known as God, which is a low-level language, and with the increasing prevalence of programming, problems increased for this language, which led programmers to develop this language, and it started to develop in several stages until it reached a high level of programming languages.
